

Feedbacks between surface processes and flexural isostasy: a motivation for coupling models

Andy Wickert, Greg Tucker, and Eric Hutton

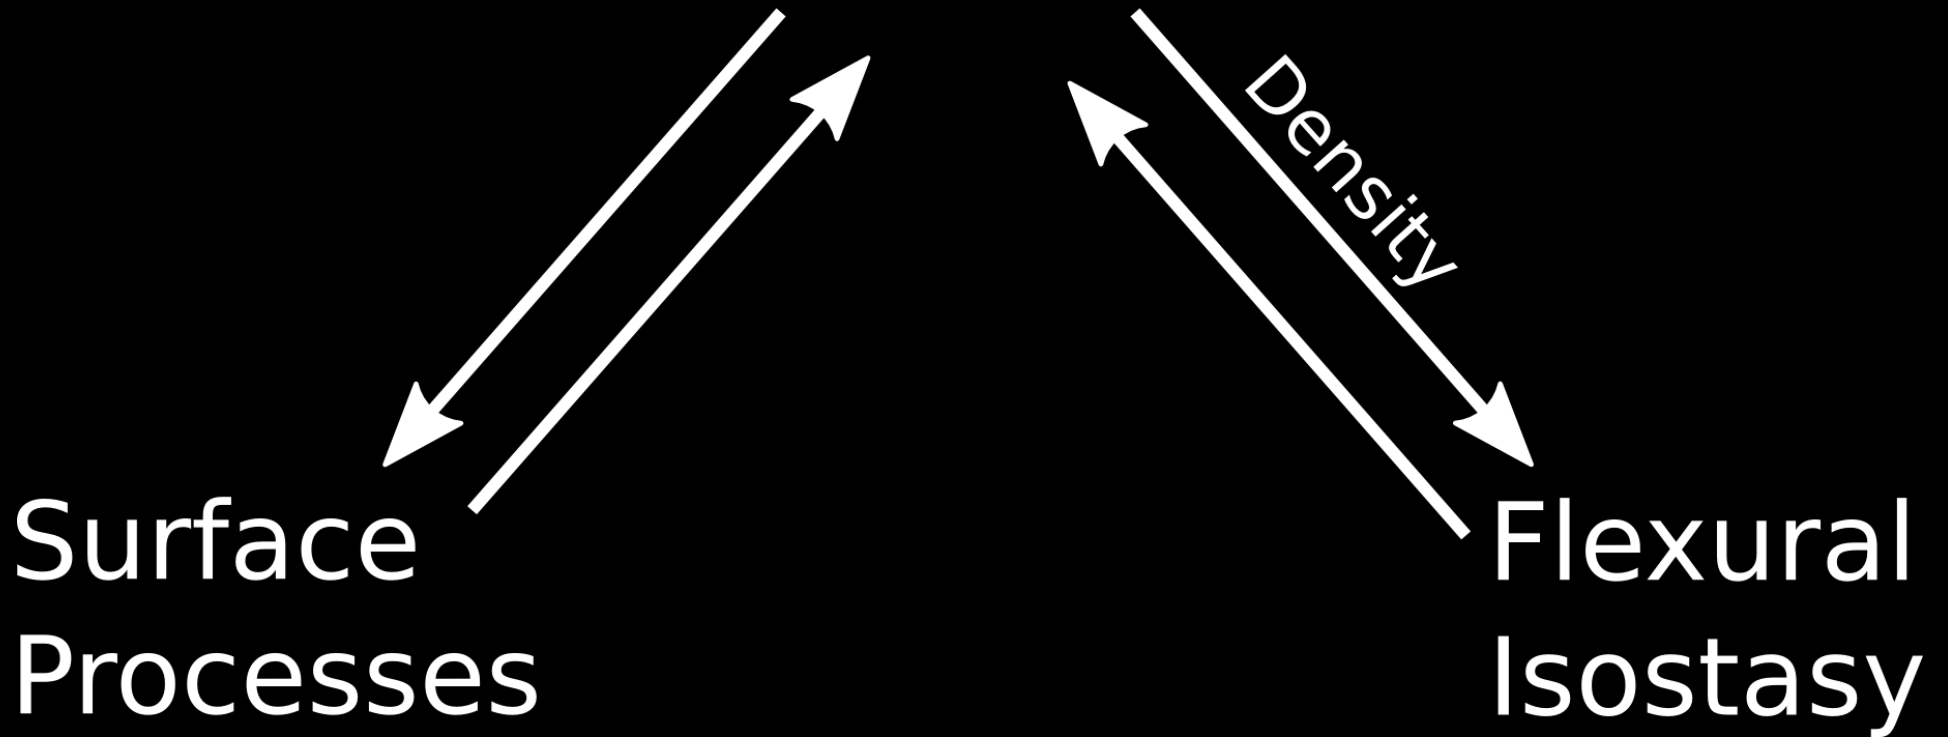

with help and advice from Beichuan Yan, Scott Peckham, and Bob Anderson

INSTAAR, Geological Sciences, CIRES, and CSDMS, University of Colorado, Boulder

CSDMS All Hands Meeting, 29 October 2011

Topography

(Surface Loads)

Topography
(Surface Loads)

Surface
Processes

Flexural
Isostasy

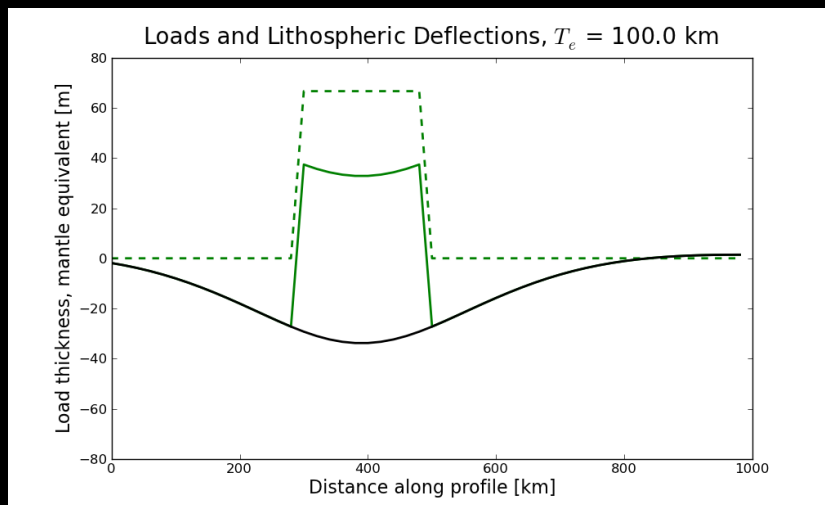

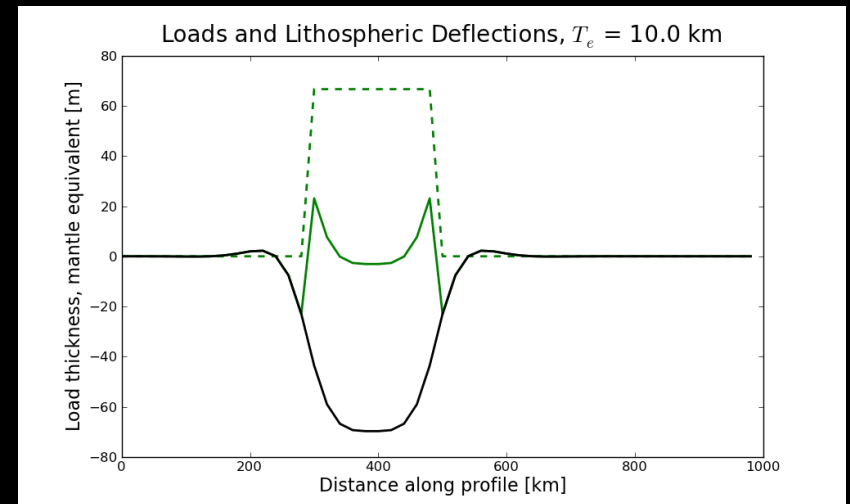

Density

```
graph TD; TP["Topography (Surface Loads)"]; SP["Surface Processes"]; FI((Flexural Isostasy)); TP <--> SP; TP <--> FI; subgraph Density; TP -- Density --> FI; end; style FI stroke:#f00,stroke-width:2px;
```

Isostasy and Lithospheric Flexure

Elastic thickness sets wavelength of isostatic compensation

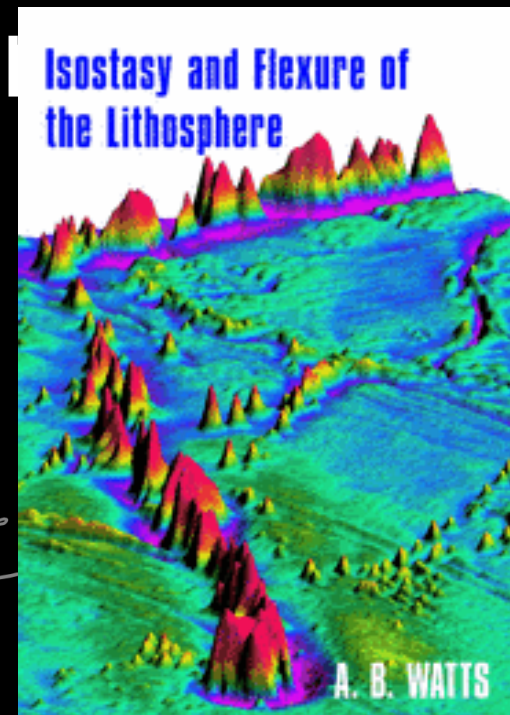

Elastic thickness sets the isostatic response, from total compensation (top left) to increasingly spread out compensation (above

Isostasy and Lithospheric Flexure

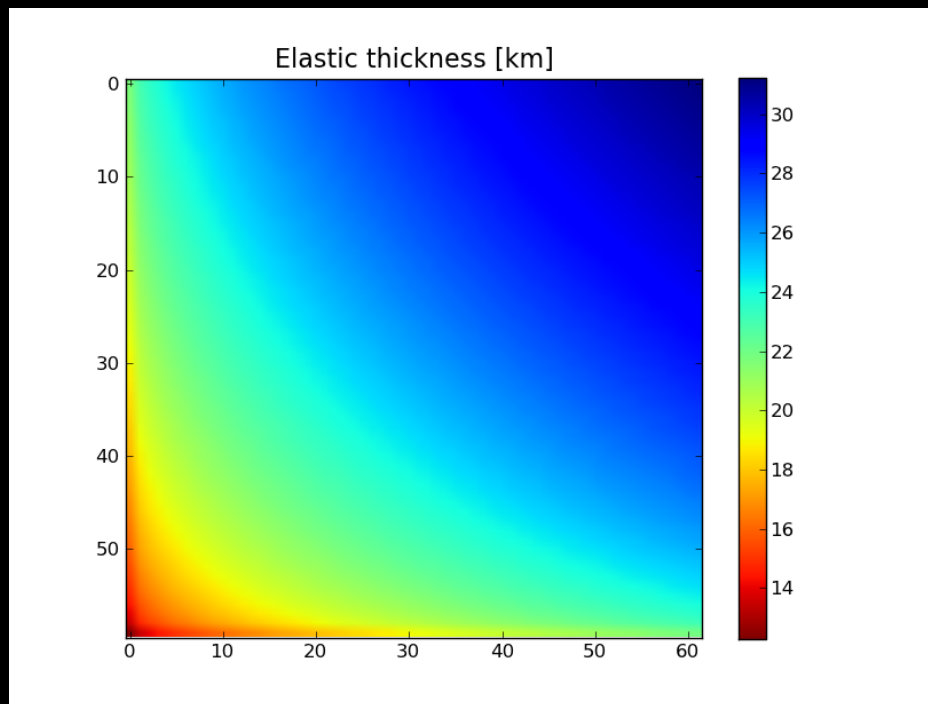

Isostasy and Lithosphere

Flexure and Isostasy Model

Numerical and analytical solutions of 1D and 2D lithospheric thin-plate flexure with constant or varying elastic thickness, written in Python

Surface-Isostatic Interactions

Surface-Isostatic Interactions ...as seen by Beach

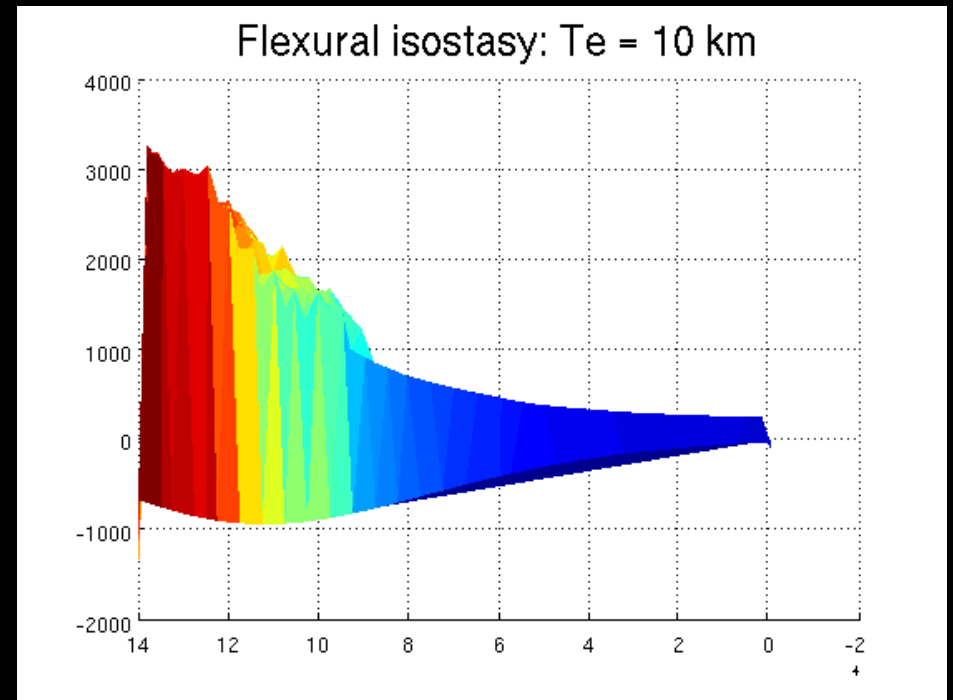

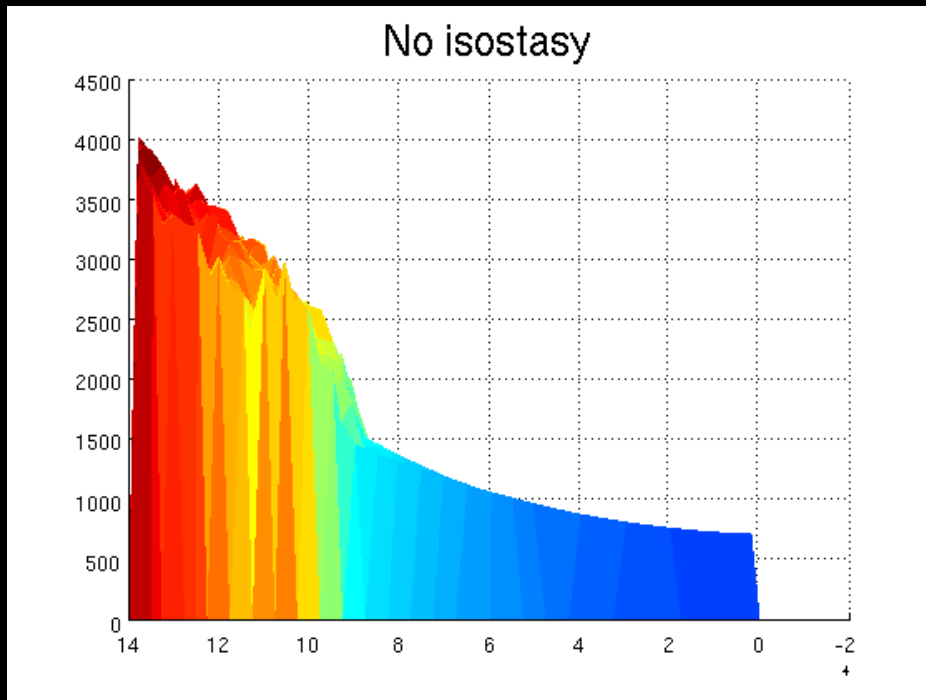

Surface-Isostatic Interactions ...as seen by Beach

Foreland Basins

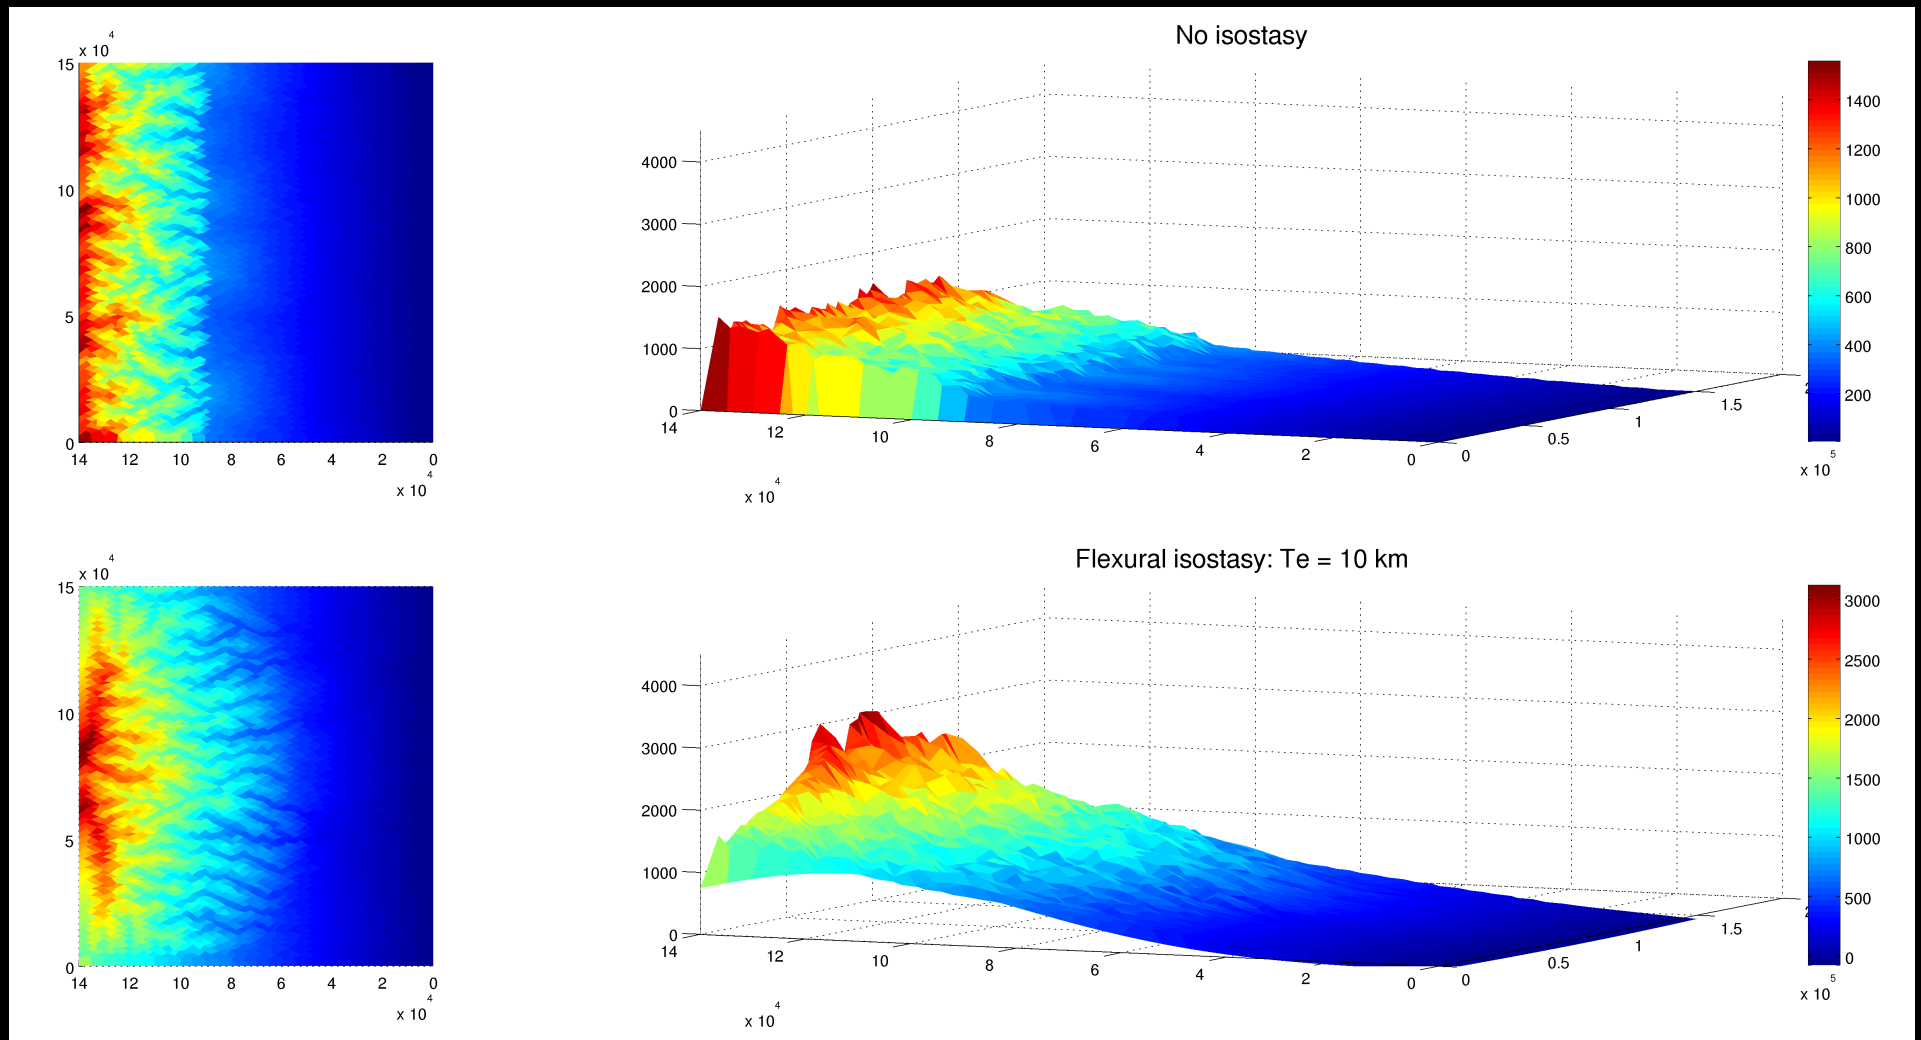

Foreland Basins

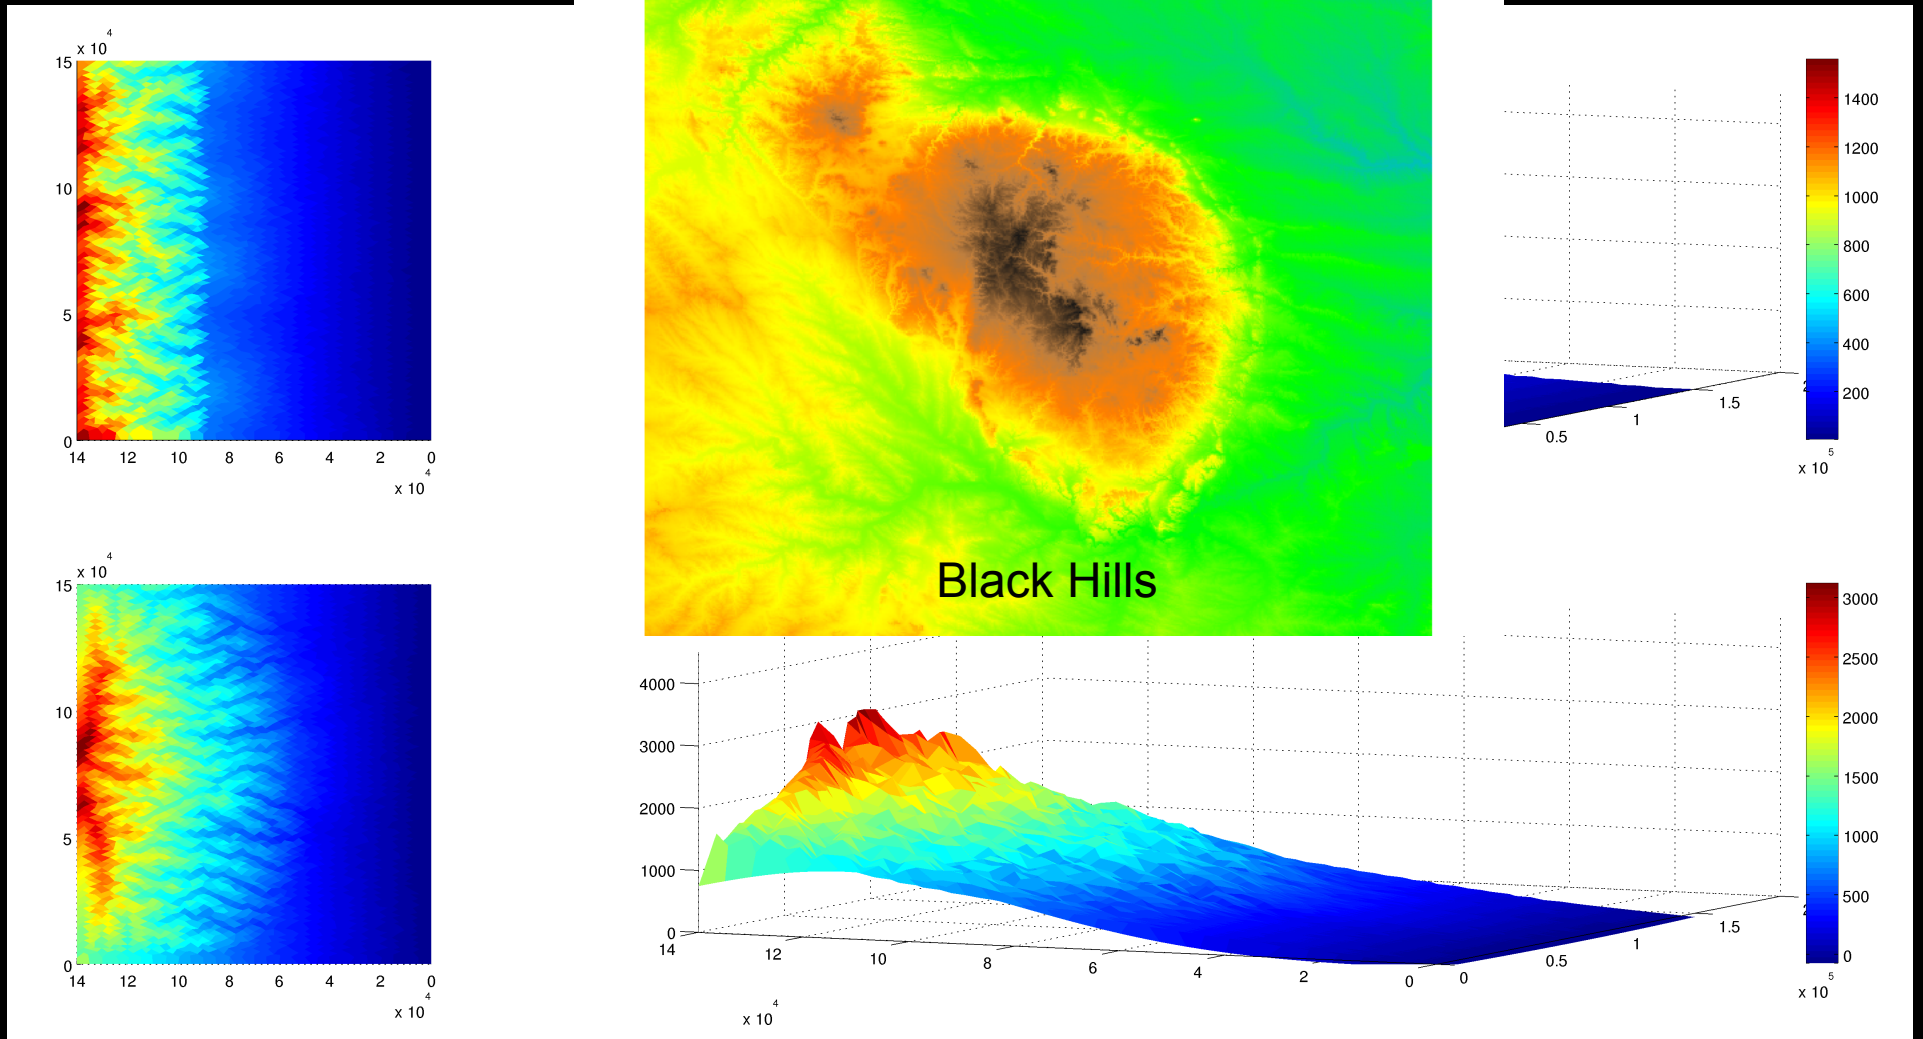

Erosional isostatic uplift of decaying mountain ranges

Erosional isostatic uplift of decaying mountain ranges

Uplift and relief generation in “decaying” mountain ranges

Couple your models, too!

(ME!)

CSDMS staff are working to make coupling models be a largely automated plug-and-play process
